

Overview of changes to the
WHODrug dictionary structure
and loading into TMS.

Introduction

- Daniel von-Sydow of WHO Uppsala Monitoring Centre
- Sunil G. Singh of DBMS Consulting, Inc.

Acknowledgements

- Thanks to OCUG for this and the TMS Focus group for this opportunity to speak.
- Thanks to the WHO-UMC for sending representation to the OCUG to share information about WHODrug.

Goals

- Provide an overview of potential upcoming changes to the WHODrug dictionary and possible implications of loading this updated structure into TMS
- These changes are preliminary, as well as their timescales. This presentation intends to raise issues to be resolved, but not necessarily solve all raised issues
- Daniel von-Sydow will address the changes in the WHODrug dictionary structure, while Sunil Singh will address the implications on loading into TMS.

Scope

- Limited to description of the changes and possible loading and maintenance implications
- The idea is to raise awareness about the structure changes and to send feedback to the WHO/UMC if there are concerns or serious issues.
- The intent of the WHO-UMC is to make improvements to the utilization of the WHODrug dictionary, and not disrupt the work of its users.

WHODrug Dictionary

- The Uppsala Monitoring Centre is launching a new output format for WHODrug
- Additional functionality for in-house use
- Additional features for WHODrug users

WHODrug changes

- New relationships for classification of products
- Additional information per product
- Herbal remedies
- New concepts: Medicinal product and Pharmaceutical Product

What's New?

Classification of Products

- A product will be given the ATC code of its most common use.
- Facilitate analysis of therapeutic groups.
- Each product will still be given one Preferred Name.
- The new coding principles will be followed for new entries from 2002.

What's New?

New Fields.

- Dosage form and Strength.
- Product Type. Medicinal/Herbal etc.
- Product Group. Same Company, Substance and ATC code. E.g. Losec/PriLOSEC.
- Market Authorization Holder. Company responsible for marketing.
- Country
- Date of last change

What's New?

Herbal Remedies

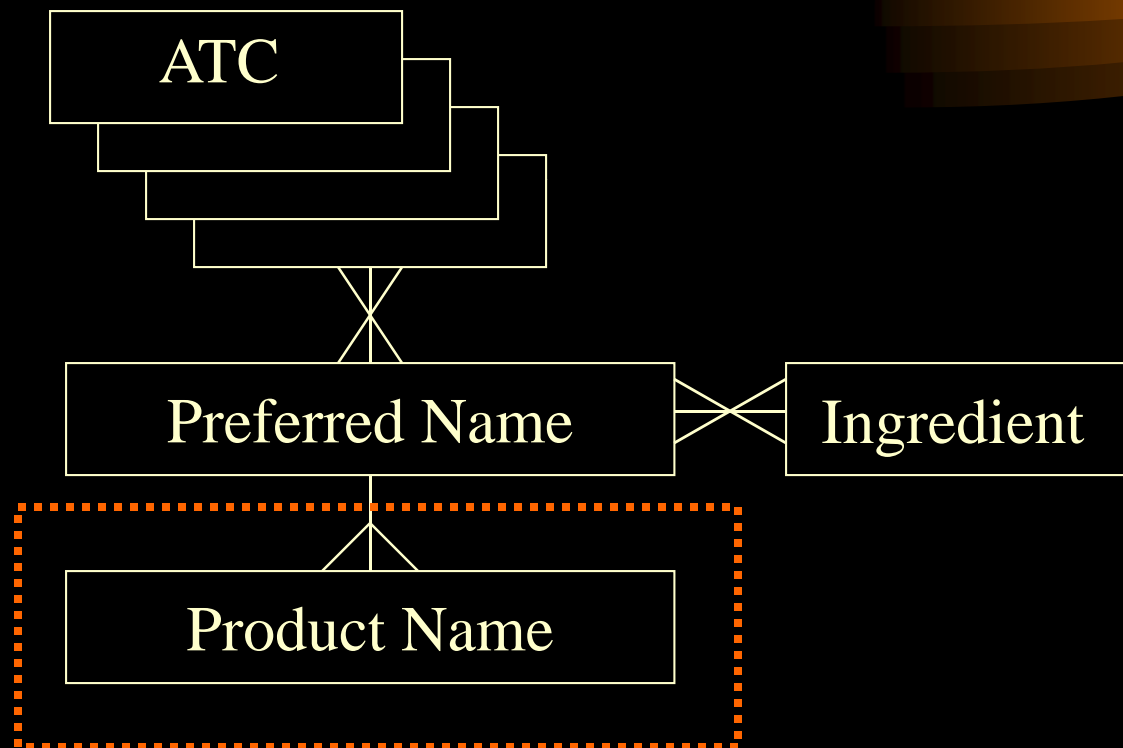

- The UMC is collecting data on Herbal Remedies to allow ADR reporting.
- A new ATC classification has been developed for Herbal Remedies.

What's New? New concept: Pharmaceutical Product.

- It will be possible to have more than one composition (tablet, solution etc) per product.
- Examples: Oral Contraceptives, Predazone/Medrol.
- Future possibility to code ADRs on Pharmaceutical Product level.

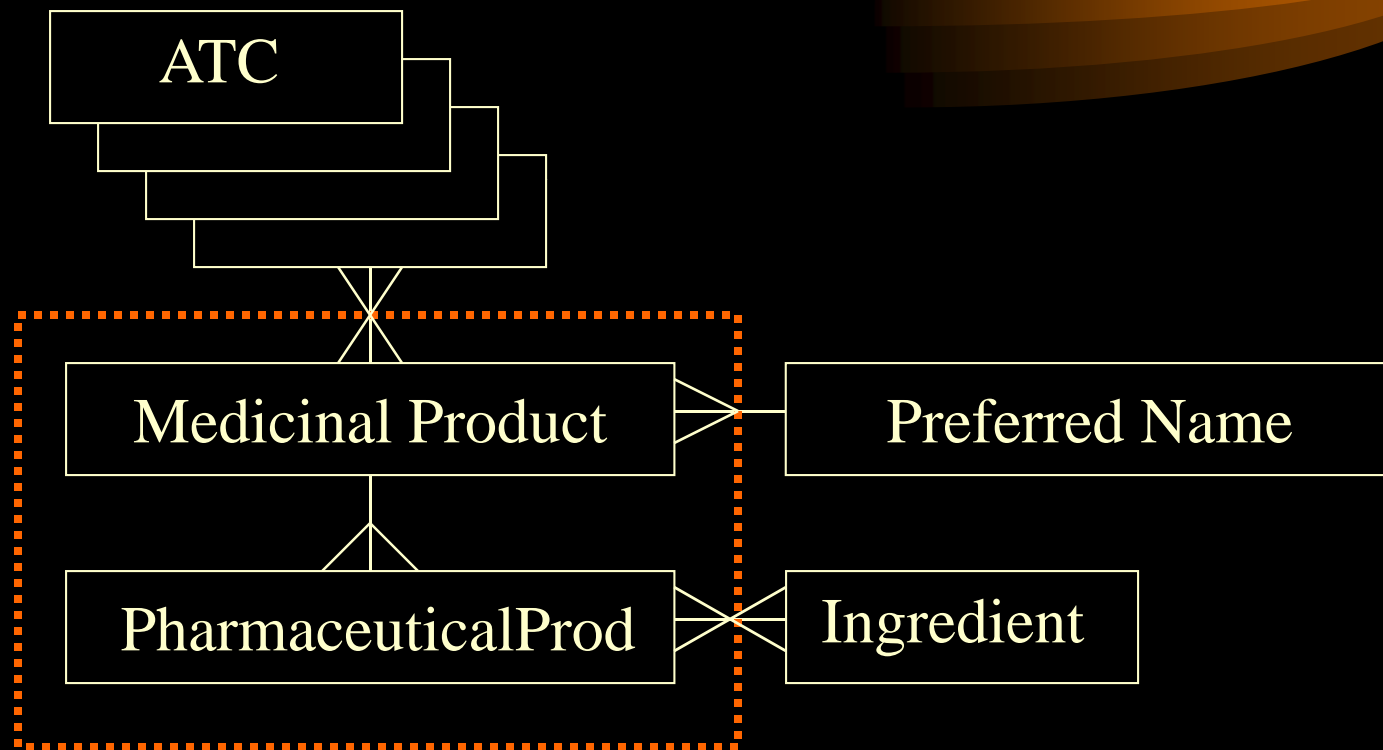

WHO Drug Dictionary

Current format

WHO Drug Dictionary

New format

When?

- All new products entered by the UMC are now coded using the new principles
- The new format will be available in flat file format from Q2 2002.
- The old format will be available in flat file format at least a year. Subject to user requirements.

TMS Loading scripts

- The aim of UMC and DBMS Consulting is to provide both formats during the transitional period.
- It should be possible for DBMS Consulting to produce loading scripts in the old format even after the flat file format is discontinued.

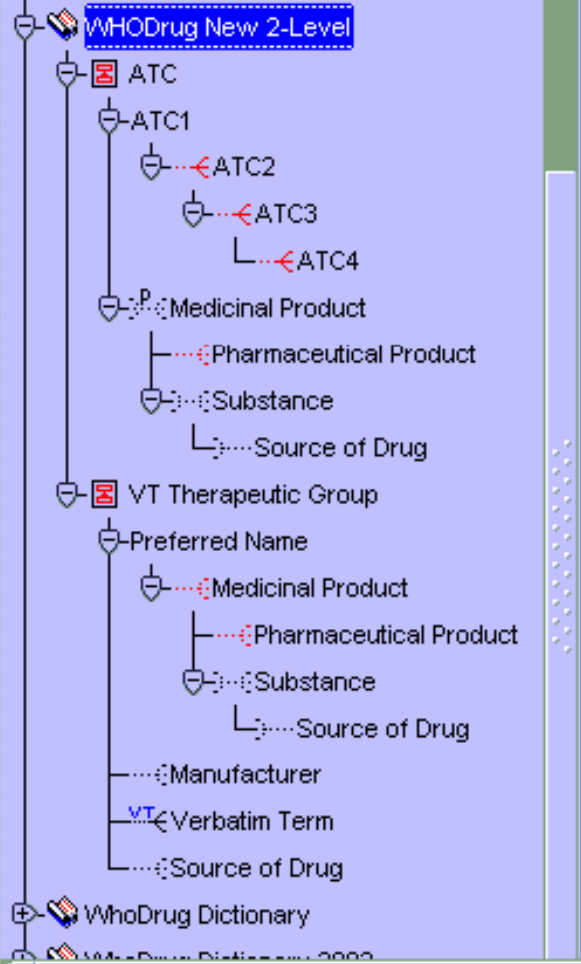

Changes for TMS Dictionary Loading process

- SQL*Loader changes:
 - DD Flat file will be replaced with MP (Medicinal Products) and PP (Pharmaceutical Products) flat files.
 - A Separate Product Group Flat File and a Country code Flat File will need to be loaded.
 - Names of other files are changing such as:
 - BNA becomes SUN
 - INA becomes ATC

Changes for TMS Dictionary Loading process (2)

- Changes to Loading Logic:
 - Additional Classification Levels Medicinal Product and Pharmaceutical Product replace Synonym Level
 - Primary Link will be indicated (but not required) from Medicinal Product Level to ATC Group
 - Some other new level details loaded for MP and PP.
 - Some other new levels will be loaded which are not on the derivation path.

The screenshot displays the Oracle OPA interface for the WHODrug Dictionary. On the left, a tree view shows the hierarchy: WHODrug New > WHODrug New 2-Level > ATC > ATC1 > ATC2 > ATC3 > ATC4 > Medicinal Product > Pharmaceutical Product > Substance > Source of Drug. The 'Pharmaceutical Product' node is highlighted in blue. The main window shows the 'Level Details' configuration for a 'Level' relation. The 'Parent' is 'Medicinal Product' (Short Name: MP) and the 'Child' is 'Pharmaceutical Product' (Short Name: PP). The 'Many Cardinality?' checkbox is checked for the child. The 'Derivable?' checkbox is checked for the parent. The 'Audit Information' section shows the record was created and modified by OPS\$OPAPPS on 15-JAN-2002.

OCUG Toronto 2001: Overview of Changes to the WHODrug Dictionary Structure

The screenshot displays the Oracle Pharmaceuticals application interface. The title bar reads "OPA (Oracle Pharmaceuticals - OPS\$OPAPPS at OCTMS40 on 15-JAN-2002)". The menu bar includes "File", "Edit", "Query", "Navigate", "Record", "Window", and "Help". The Oracle logo is in the top right corner.

The left pane shows a hierarchical tree structure of the WHODrug Dictionary. The "WHODrug New 2-Level" folder is expanded, showing the "ATC" level. Under "ATC", there are sub-levels "ATC1", "ATC2", "ATC3", and "ATC4". The "Medicinal Product" level is highlighted in blue. Below it are "Pharmaceutical Product", "Substance", and "Source of Drug". The "VT Therapeutic Group" folder is also visible, containing "Preferred Name", "Medicinal Product", "Pharmaceutical Product", "Substance", "Source of Drug", "Manufacturer", "Verbatim Term", and "Source of Drug".

The main pane shows the "Level Details" configuration for the "Level" relation type. The "Relation Type" is set to "Level".

Field	Parent Value	Child Value
Level Name	ATC	Medicinal Product
Short Name	ATC	MP
Mandatory?	<input type="checkbox"/>	<input type="checkbox"/>
Many Cardinality?	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Primary Link?	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Modified By	OPS\$OPAPPS	Modification Time	16-JAN-2002 02:15:33

The status bar at the bottom shows "Relation type" and "Record: 1/1".

Other considerations

- Only a small percentage of Medicinal Products will have Pharmaceutical Products associated with them.
- There will still be many cases where multiple ATC codes exist for a Medicinal Product. Relating ATCs to Medicinal Products may reduce the number of multiple ATCs, but will not create a 1-1 relationship.
- New additional fields and tables will not be populated for legacy drug entries before a recent time that has not been determined, probably 1-2 years.

Mapping Legacy WHODrug Structure to new Structure.

- Virtual dictionaries will not be able to map old WHODrug to new WHODrug Structure, since virtual dictionaries expect the same structure.
- Cross dictionary links and Named Relations are a possible way of mapping terms across the two dictionary versions, but this might be an arduous process. It may be possible to develop calls to TMS APIs to populate these named relations. This may also require that the new version be loaded in the same domain and Activation Group.

Mapping Legacy WHODrug Structure to new Structure (2)

- Loading scripts could instead be adjusted to mirror legacy WHODrug structure, and load into this same structure. This may be the supported long-term path for maintaining studies that require the existing WHODrug structure.

Conclusions

- Feedback is required regarding changes to WHODrug dictionary structures.
- There is flexibility in the nature of changes and timescales of deployments.
- A supportable path will be provided to migrate to this new structure or maintain the legacy structure until some undetermined point in the future.

Questions ?

- For more information about changes to WHODrug please contact Daniel.von-Sydow@who-umc.org
- For questions regarding the updated WHODrug within TMS, please contact singh@clinicalserver.com
